

# Cloud based system for storing, visualisation and analysis of genomics and metagenomics data of BIG4 Order

Presentation By :  
Ashish Tomar

# Objectives

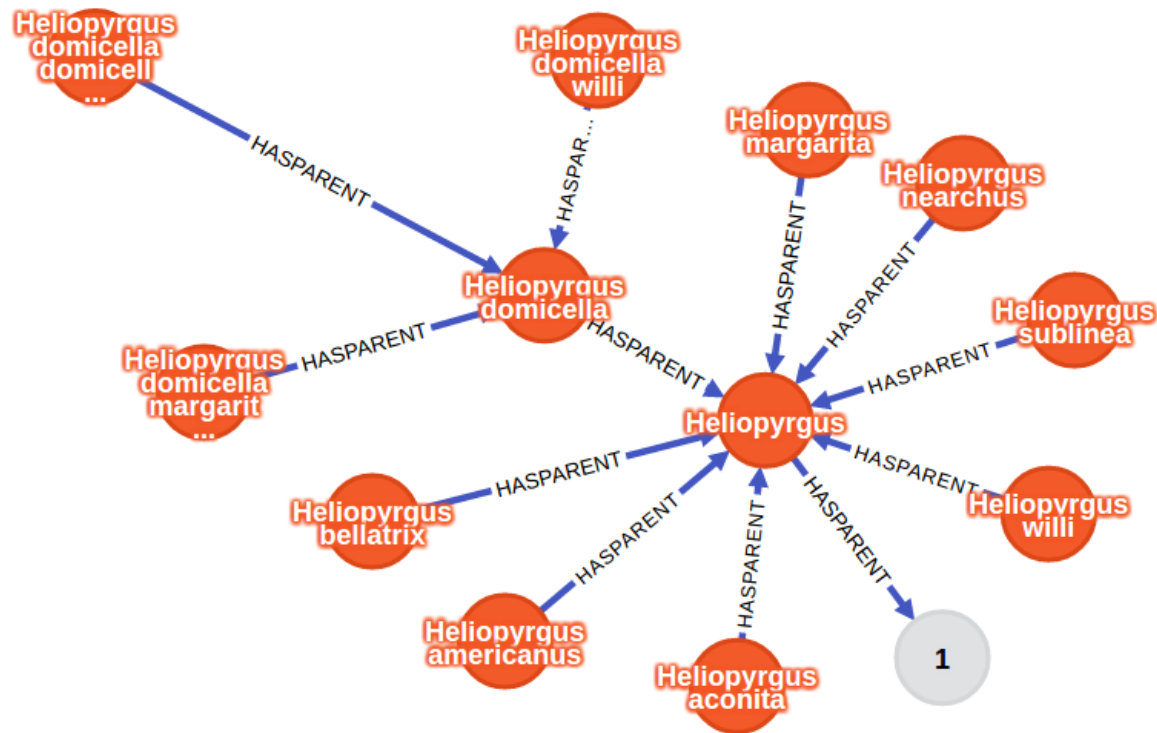

- Designing, developing and testing of innovative and interactive visualization tools for biological Big Data.
- To design, implement and test Bio4j queries and a biological interface adapted to the knowledge area of systematics.
- **Results**
  - One complete and two prototype applications for metagenomics visualization.
  - Phylogenetics Visualization library in Javascript
  - Phylogenomics visualization web app
  - Geographical phylogenetic data visualization prototypes

# Graph Database

- A graph database is a database that uses graph structures for semantic queries with nodes, edges and properties to represent and store data.
- A key concept of the system is the graph (or edge or relationship), which directly relates data items in the store.
- The relationships allow data in the store to be linked together directly, and in most cases retrieved with a single operation.
- Graph databases employ nodes, edges and properties.
  - Nodes represent entities such as people, businesses, account, taxons etc.
  - Edges, also known as graphs or relationships, are the lines that connect nodes to other nodes; they represent the relationship between them ( such as a node genus is parent of species or subspecies node )
  - Properties are pertinent information that relate to nodes. For instance a genus node having taxon id, parentId, taxon name, etc.

# Neo4j And Taxonomy Data

- Representing taxonomy as graph data
- The butterfly genus *Heliopyrgus* having species and subspecies as child nodes.

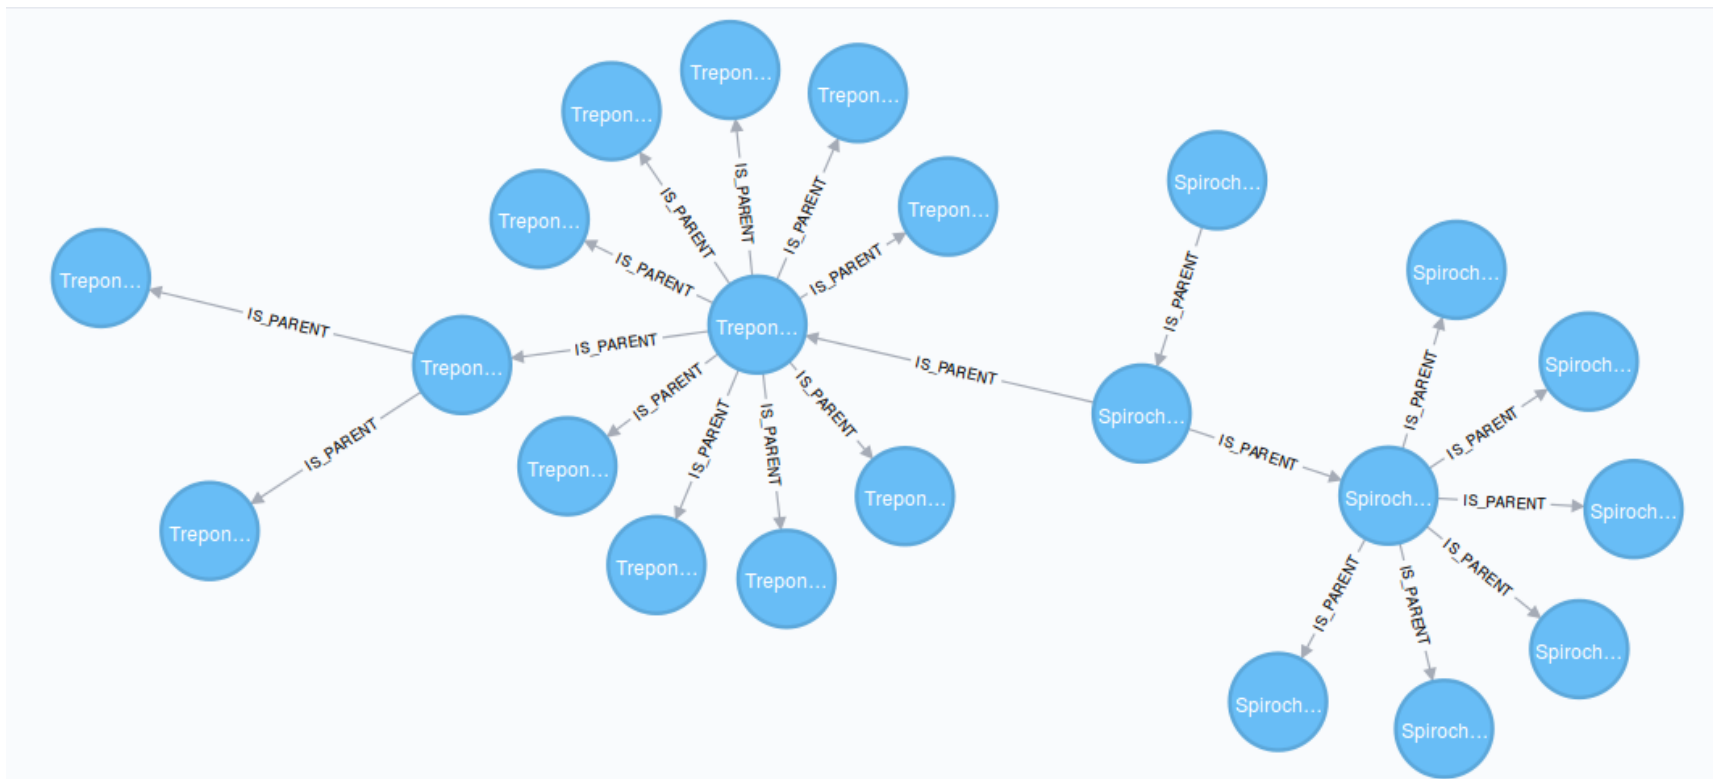

Taxonomy data in graph format.  
Heliopyrgus genus is shown with sub species and species as the child nodes

# Graph Database And NCBI Taxonomy Data

Bio4j is a bioinformatics graph based DB including

- UniProt (SwissProt + Trembl)
- Gene Ontology (GO)
- RefSeq
- NCBI taxonomy

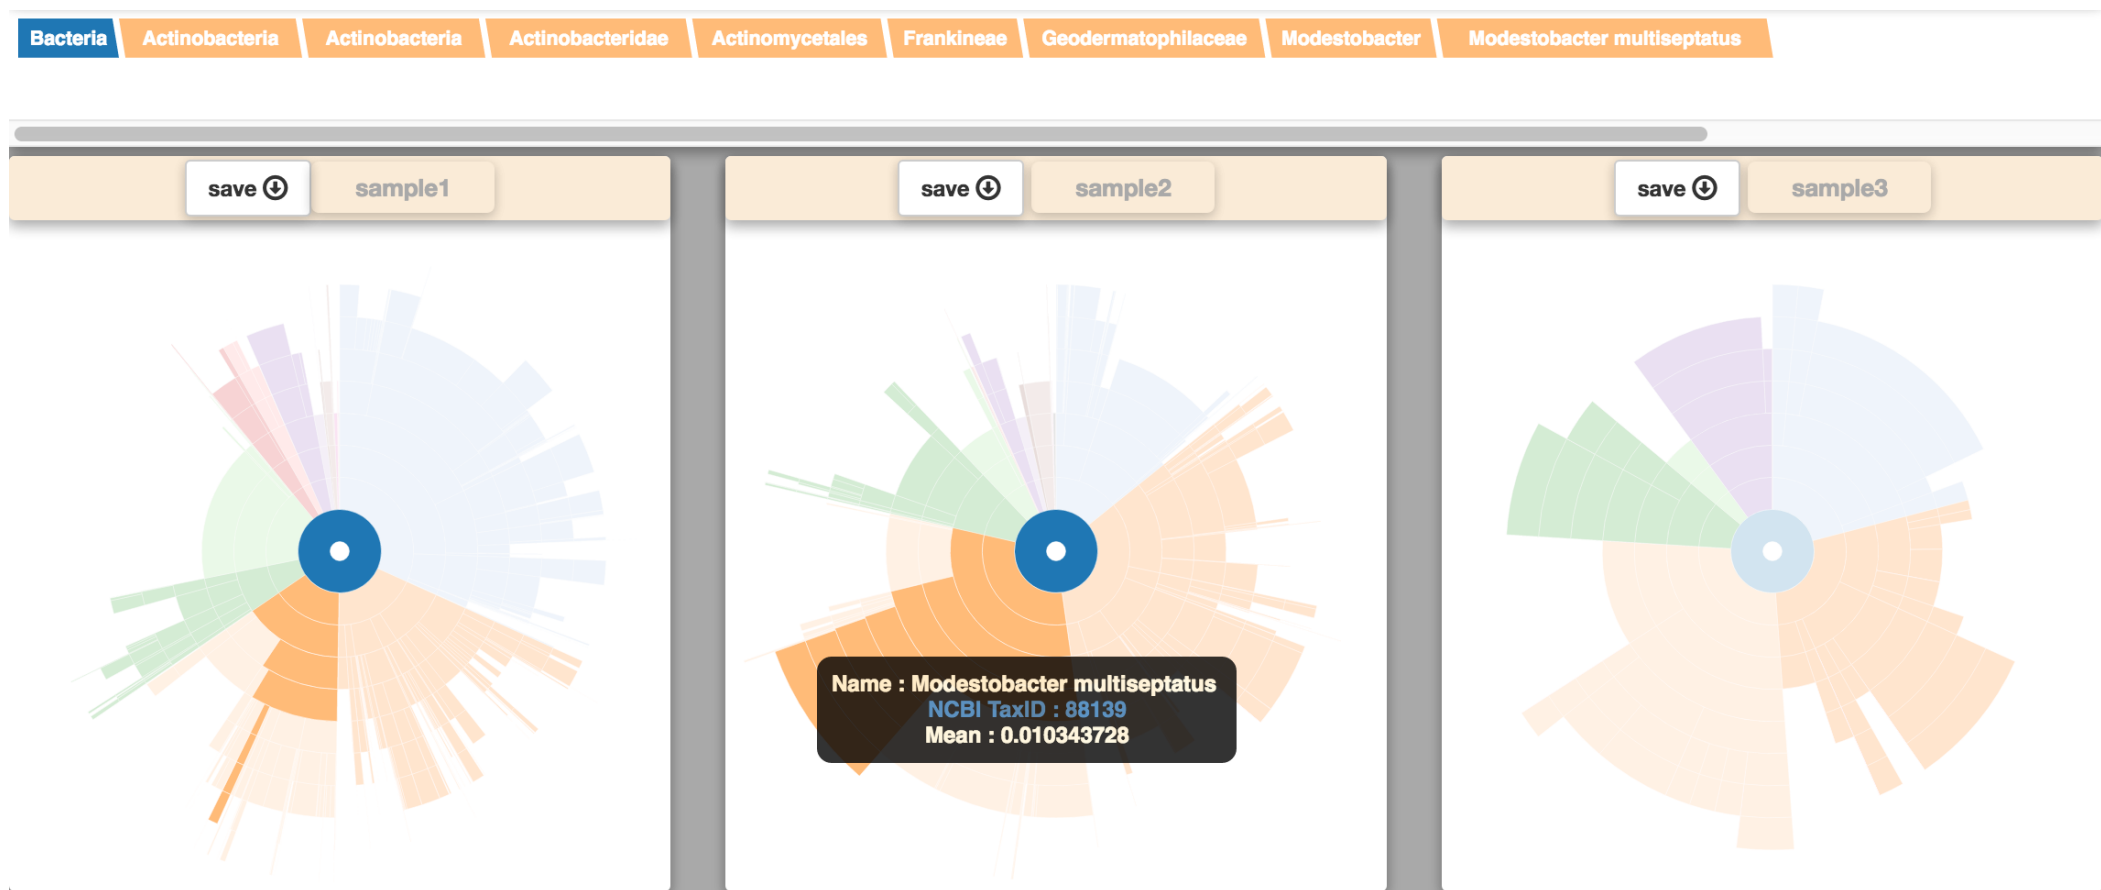

NCBI taxonomy data as graph database.

# Metagenomics Data Visualization

- Distilling metagenomics data into graphical representations, however, is not a trivial task.
- The foundation of most metagenomics studies is the assignment of observed nucleic acids to taxonomic or functional hierarchies.
- Space filling diagrams ( sunburst and treemap ) convey hierarchy implicitly via angular subdivision.
- Furthermore, taxonomic and functional hierarchies are often too complex for all nodes to be shown, and wide variations in abundances can be difficult to represent.

# Metagenomics Visualization Web Application

# Phylogenetic Data Visualization

- D3.js has allowed rich and dynamic data visualization in bioinformatics web application.
- The exploratory analysis using the data integration and the visualization has made biological data more intuitive.
- Representation of tree data structures has become very popular in different biological fields like phylogenetics and metagenomics visualization
- Combining phylogenetic tree with other data such as expression data, protein sequence domains, gene structure etc. can make analysis more exploratory and intuitive.

# Phylogenetic Data Visualization

- **Objective :**
  - A open source dynamic library for generating phylogenetic tree with genomics data integration based on d3.js
  - A Web based application interface for providing phylogeny tree visualization.
- **Library :**
  - D3.js : D3 is a JavaScript library for manipulating documents based on data.
  - JQuery : jQuery is a fast, small, and feature-rich JavaScript library.
  - Javascript : programming language of HTML and the Web
- **Input :**
  - Newick or nexus tree data format
  - Optional Data : Integration of genomic data such as expression data, gene structure, protein domain, etc. in form of JSON format

# Phylogenetic Tree Without Branch Scaling

Fig1. Phylogenetic tree with no branch scaling

# Phylogenetic Tree Branch Length Scaling

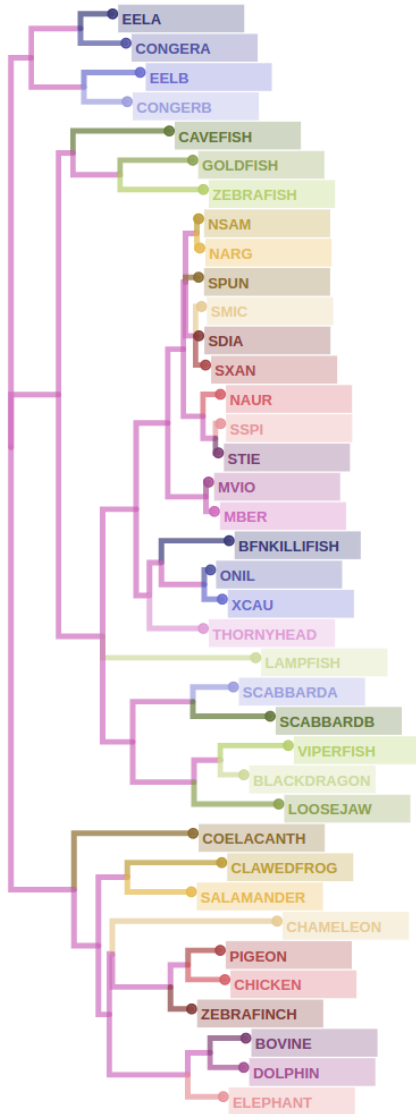

Fig2. Tree with branch scaling and no extended links

Fig3. Tree with branch scaling and extended links

# Phylogenetic Tree And Bar chart

Fig4. Phylogenetic tree with bar chart

# Phylogenetic Tree And Pie chart

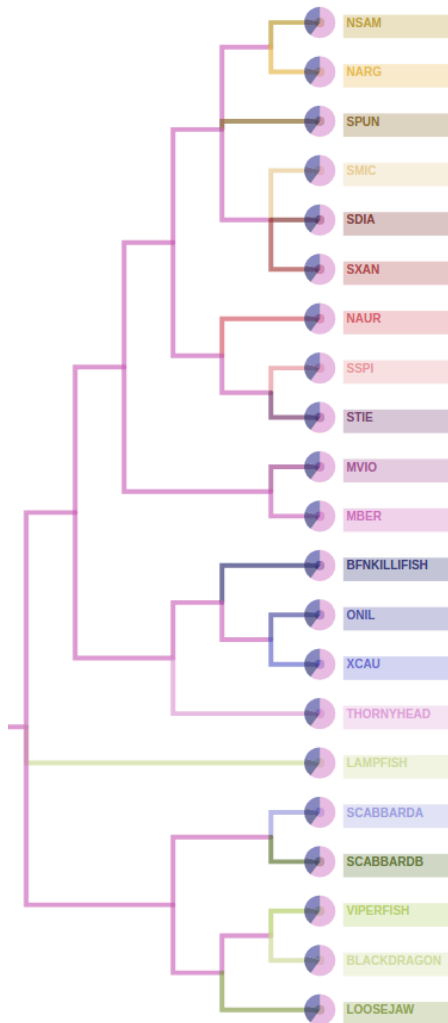

Fig 5. Phylogenetic tree with leaf nodes with pie chart

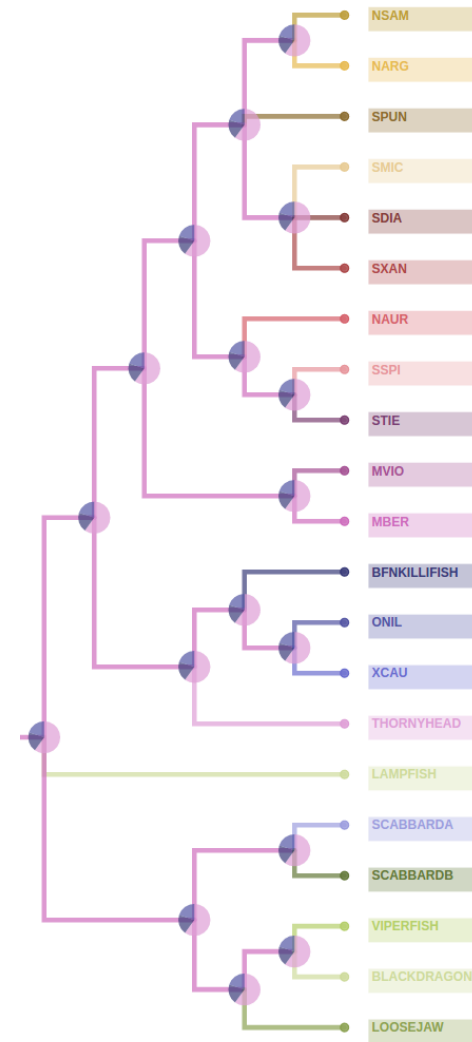

Fig 6. Tree with inner nodes with pie chart

# Phylogenetic Tree And Sub tree

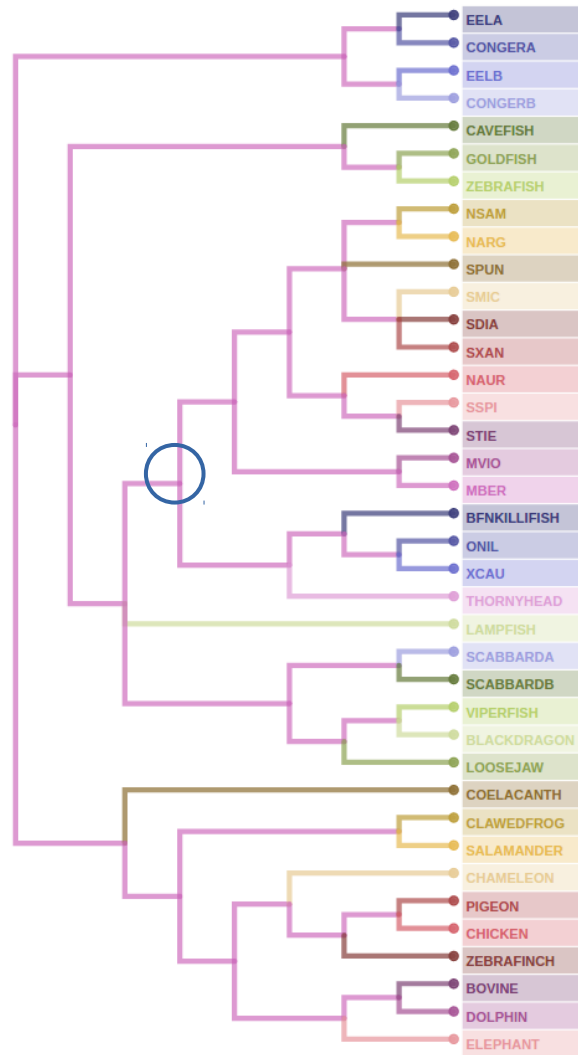

Fig 7. Phylogenetic tree (circle shows the branch point of subtree)

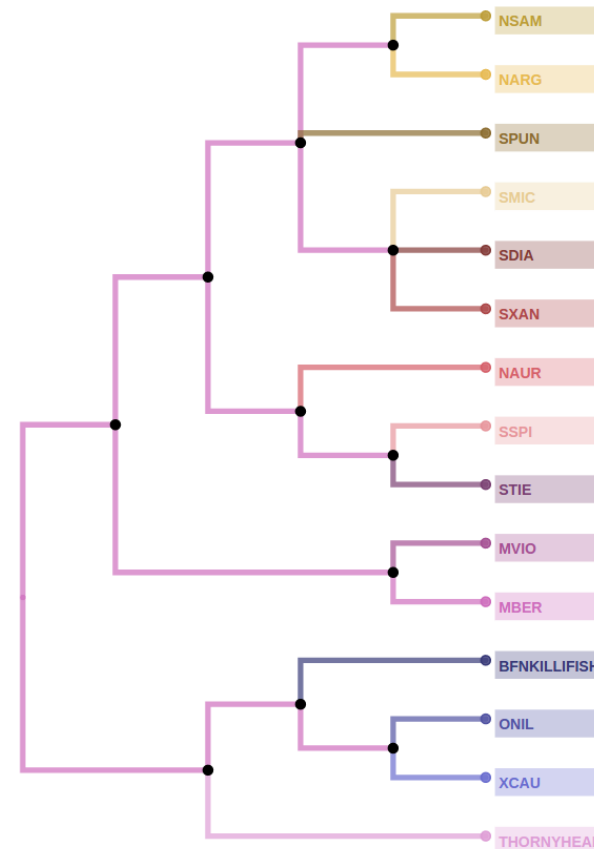

Fig 8. Sub tree after click on branch point of main tree

# Phylogenetic Tree And Expression Data

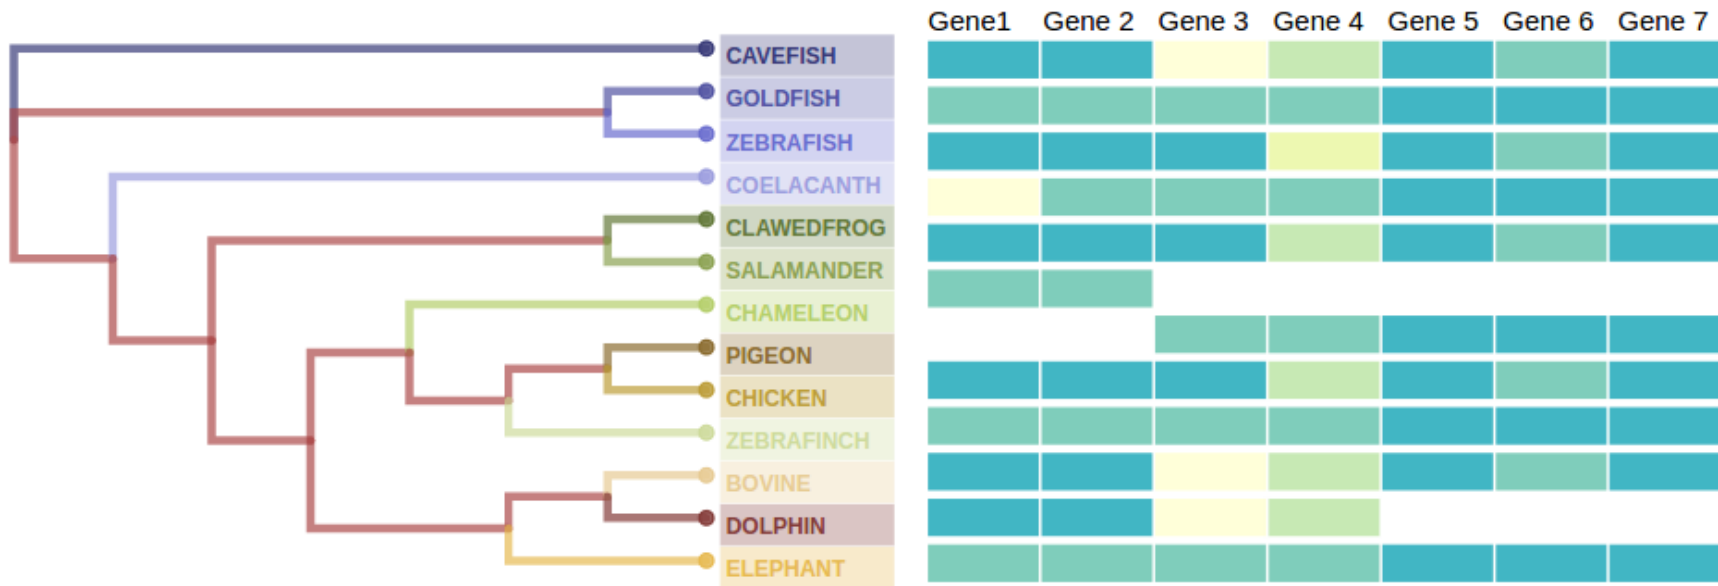

Fig 9. Phylogenetic tree with gene expression data

# Phylogenetic Tree And Protein Domain Visualization

Fig 10. Phylogenetic tree with protein domain

# Phylogenetic Tree And Gene Structure Visualization

# Phylogenetic Radial Tree

Fig 12. Phylogenetic radial tree

# Geographical Phylogenetic Visualization

- Visualization of geographically distributed data will help in analyzing taxon wise species distribution.
- Geographically distributed data can be visualize with integration of other data such as IUCN status, heatmap, pie chart etc.
- Geographical visualization will help in understanding species richness or taxon data in different geographical location.
- Thus geographical visualization of “Big4 order” will increase the potential by simplifying the process of data exploration and analysis.

# Geographical Phylogenetic Visualization

- Objectives :
  - To provide a framework to visualize and access information about the distribution of species and the BIG4 order composition geographically.
  - Visualize and explore aggregate diversity patterns such as species richness and other biogeographic patterns of different BIG4 order.
  - To create a framework to integrate data to biodiversity data for visual enrichment analysis.
  - To create a dynamic design for the visualization of biodiversity data

# Geographical Phylogenetic Visualization

# Geographical Phylogenetic Visualization

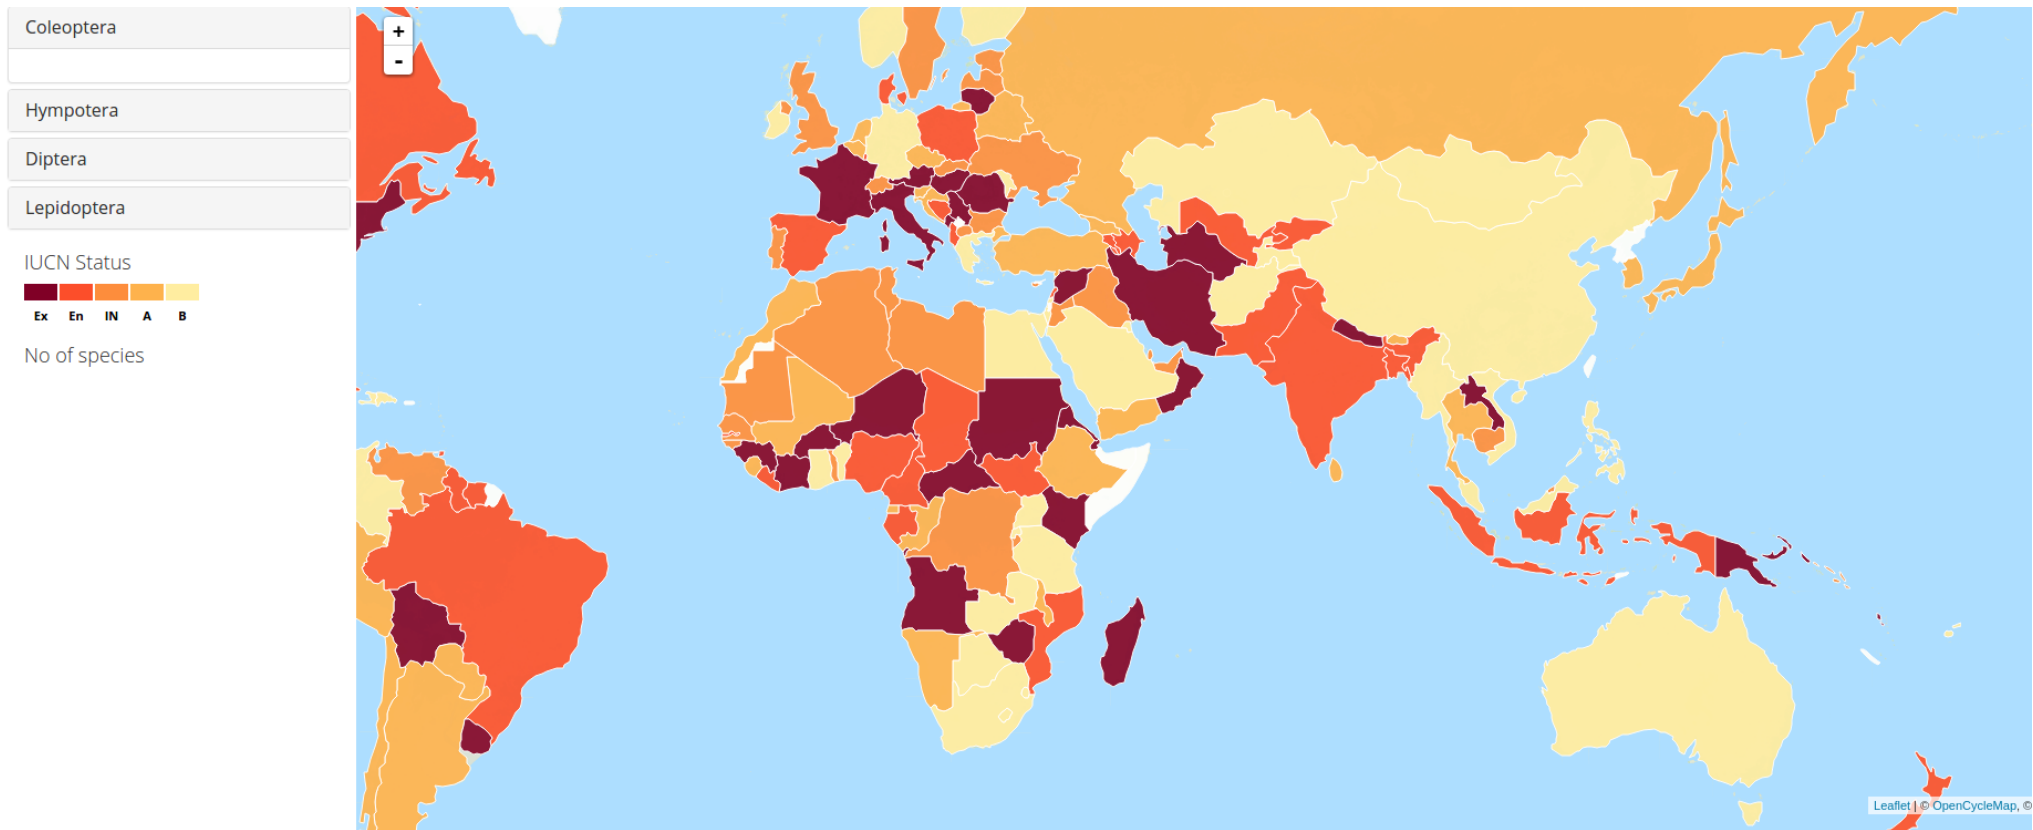

Fig 14. Phylogenetic tree information for clicked geographical location

# Future Plans

- Creating REST api for querying bio4j based graph database for NCBI taxonomy database
- Metabarcoding visualization
- Upgrading features to geographical phylogenetic data visualization web application
- Develop a querying layer on top of Bio4j platform specific for BIG4 knowledge area at server side and a visualization layer at client side

# Future Plans (PhD Thesis)

## Tree Visualization in Biology

- A tree as a case of a graph and specially of a DAG (Directed Acyclic Graph).
- Identification of special problems dealing with large data sets as the whole taxonomy.
- Javascript, CSS , HTML5 and WebGL
- Libraries: D3, Three.js, create.js and Sigma.js
- In summary, the objectives are:
  - To compile and analyze tree visualization tools in general.
  - To develop new methods and integrating them with third party solutions to solve some of these problems

# Fundings

Funding from the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 642241

Thank  
you
